regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SMISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP http://www.sanger.ac.uk/Projects/C_elegans/wormpep RP23-407M20 is from the RPCI-23 Mouse PAC Library constructed by the group of Pieter de Jong. now 15, 2002 this sequence version replaced gi:23906235.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgum sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each config described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold', individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consists entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature Liu,J., Liu,W., Liu,Y., Lebow,H., Levan,L., Lewls, L., Lunda,J.,

```
Submitted (20-JUL-1997) Department of Molecular Biotechnology, Box Submitted (20-JUL-1997) Department of Molecular Biotechnology, Box 35730 University of Mashington, Seattle, Washington 98195, USA Sequencing methodology, high redundancy shofgun. Based on overlapping cosmids, the precision of this sequence is 99.93. Libraries were derived from two strains but there was no discernable sequence variation between them. This sequence contains numerous internal duplications, especially in the rypsinogen genes. Interspersed Repeats were identified with RepeatMasker (available from http://ftp.genome.washington.edu/RW/RepeatMasker.html) Several new fully classified. Simple sequence repeats were identified with sputhik (available from http://serac.mbt.washington.edu/~chrisa/software/sputnik.html)

The authors thank Christopher Nelson for his gift of cosmids from Dennis Loh's library.

Differential transcriptional regulation of individual TCR V beta segments before gene rearrangement
J. Immunol. 166 (3), 1771-1780 (2001)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4 TGTTTGCCTATCCACCTCCCCCAAGCCCCTTTACCTATGCTGCTGCTAACGCTGCTGCTG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter.

This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

1 199221: contig of 199221 bp in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         / Match 9.1%; Score 42.6; DB 2; Length 199221; Local Similarity 58.1%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence was finished as follows unless otherwise noted:
                                                                                                                                                                                                                                                                                                                                        Center: Washington University Genome Sequencing Center

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NOTICE: This sequence may not represent the entire insert of this schone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

Baylor Plaza, Houston, TX 77030, USA.
On Nov 19, 2002 this sequence version replaced gi:23322236.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgum sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold') within each contig-scaffold') within each contig-scaffold' by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 13 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Assembly program: Phrap; version 0.990329

/note="Organ: Lung; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site 1: EcoR 1; Site 2: Not I;
UT-CF-EC1 is a normalized cDNA library containing the following tissue(s): Normal lung from adult and from fetal day 64, day 87, week 19 and week 42. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:191-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, dispested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the NATALLY CONTAINED ANALY CONTAINED AND A CONTAINED AND A CONTAINED AND A CONTAINED ANALY CONTAINED AND A CONTAINED AND A CONTAINED AND A CONTAINED ANALY CONTAINED AND A CONTAINED AND

Bento Soares, University of Iowa Clone Distribution: Clone distribution.	from Dr. M. Bento Soares, bento-soares@ulowa.edu The following repetitive elements were found in this cDNA sequence: 409-448, > (CAG)n#Simple_repeat	Seq primer: M13 FORWARD POLYA=Yes.		/mol_type="mRNA" /db_xref="taxon:9606" /clos="Ul-H-awl-m-06-0-Ul" /tiense:"Mol="Mol-set="ta"	/ dev stage="Mault" // lab_host="DH10B" (Life Technologies)"	/clone_lib="NCI_CGAP_DTI" /note="Organ: Lung; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site_1: EcoR I; Site_2: Not I;	ALL USE THI IS A NOTMALIZED CONA LIDRARY CONTAINING THE FOLLOWING TISSUE(8): Metatastic Chondrosarcoma in Lung. The library was constructed according to Bonaldo, Lennon	and Soares, Genome Research, 6:791-806, 1996. First strand CDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated	to an Ecox 1 adaptor, digested with Not 1, and cloned directionally into pTyT3-per covector. The oligonucleotide used to prime the synthesis of first-errand cDNA contains	a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dry primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pY773-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dY)18 tail. The sequence tag for this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi, Mammalia, Eutheria, Primates, Catarrhini, Hominidae, Homo.

normalized libraries (melanocyte 2NbHW, pregnant uterus NbHPU, and fetal heart NbHH19W) were mixed, and se circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from pools of 5,000 clones made from the same 3 libraries. The pools of 340488-345479, and 484488-489479."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AA099445

double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not and Eco RI sites of the modified pTyT3 vector. Library went through one round of normalization. Library

Following HAP purification, so circles were maded as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1257096-1258631, 1469064-1470993, and 1475592-1476431.
      Clone distribution: NCI-CGAP clone distribution information can be
